

Monitoring of containers

Automatically monitor your container and anticipate related actions that need to be taken.

Challenge

The quantity of containers and the amount of products they contain make it difficult for employees to keep track of them.

Solution

Based on camera images, our algorithms detect the containers and identify the characteristics of their load (category, homogeneity of content, fill rate, etc.).

Results

Decisions about future actions are facilitated: the next location of the container, its optimal replacement date, etc. The quality of their contents is ensured through automatic detection of unwanted elements.

Other applications

Applications of this solution are endless. It can be used for any goods or products contained in a container. If you want to control your waste sorting, your flow of goods or others items, contact us.
