

Automatic assignment of customs code

Automatically identify the type of product being processed and assign the appropriate HS code according to its characteristics. The package can then be sent and processed by customs.

Challenge

Customs codes are combinations of 10 digits, with the last two specific to the country of origin. These characteristics make the allocation of customs codes and their control very complex.

Solution

Using the textual description of a good, our algorithms can identify the customs code that should be assigned to the product.

Results

Errors are reduced, accuracy and speed of allocation are increased. As a result of this increase in efficiency and the avoidance of fines, the associated costs are significantly reduced. This solution, applied to customs, also makes border crossings more fluid.
